this book addresses an intriguing question are our decisions rational it explains seemingly irrational human decision making behavior by taking into account our limited ability to process information it also shows with several examples that optimization under granularity restriction leads to observed human decision making drawing on the nobel prize winning studies by kahneman and tversky researchers have found many examples of seemingly irrational decisions e g we overestimate the probability of rare events our explanation is that since human abilities to process information are limited we operate not with the exact values of relevant quantities but with granules that contain these values we show that optimization under such granularity indeed leads to observed human behavior in particular for the first time we explain the mysterious empirical dependence of betting odds on actual probabilities this book can be recommended to all students interested in human decision making to researchers whose work involves human decisions and to practitioners who design and employ systems involving human decision making so that they can better utilize our ability to make decisions under uncertainty
